                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymucleotides are also used in diagnostics as expressed sequence (II). The CC polymucleotides are also used in diagnostics as expressed sequence tags (II) or in the treat disease states involving CC (II), (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical considers involving aberrant protein expression or biological activity. (II) are suppressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. (IT polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations (II) and (II) are useful in produce other types of data and products dependent on DNA and CC amino acid sequences ABG00010-ABG30377 represent novel human (II) and (II) are sequence data for this patent did not appear in the printed consecutive of the invention.

CC Specification, but was obtained in electronic format directly from WIPO at fits, wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The products of the invention have antitumor activity. Polypeptides (I). encoded by (A) are used: (i) for identifying agents for treatment of prostatic cancer and (ii) for therapy of prostate cancer, optionally where expressed by gene therapy methods. (A) is also used to isolate full-length genes (for gene therapy) and for recombinant production of (I), which can be used to raise specific antibodies. (A) are identified by assembly of ESTs (expressed sequence tags) before they are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTs. AAV48215-Y48303 represent protein fragments encoded by the expressed sequence tags described in the method of the
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides havious cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and

                                                    expressed at high level in prostatic tumor tissue and encode gene products or their fragments. The products of the invention have antitumor activity. Polypeptides (I) encoded by (A) are used: (i) for identifying agents for treatment of prostatic cancer and (ii) for therapy of prostate cancer, optionally where expressed by gene therapy methods. (A) is also used to isolate full-length genes (for gene therapy) and for recombinant production of (I), which can be used to raise specific antibodies. (A) are identified by assembly of ESTs (expressed sequence tags) before they are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTs. ANY48215-Y48303 represent protein fragments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                       This invention describes novel nucleic acid sequences (A) that

                                                                                                                                                                                                                                                                                                                                                                                                           the treatment of herpes virus infection. The method comprises forming a herpes virus polypeptide/zinc complex; adding a test agent to the polypeptide/zinc complex; and detecting any change in the complex. The invention also relates to the use of known agents, such as 2,2'-dithiobishenzamide (DIBA) and azodicarbonanide (ADA), and unknown agents for the manufacture of a medicament for the treatment of herpes virus infections. The method is useful for detecting agents for use in the treatment of herpes virus infection. The present sequence is Herpes simplex virus type 2 (HSV2) IE63 protein homologue. HSV2 belongs to alphaherpes virus sub-family. IE63 protein is also called ICP27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of detecting an agent for use in the treatment of herpes virus infection.                                                                                                                                                                                                               5
                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes primer sets for synthesising 5602 (C full-length cDNAs defined in the specification. Where a primer set (c comprises: (a) an oligo-dT primer and an oligonucleotide complementary (CC to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination (CC oligonucleotide comprises) a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end (C sequence and an oligonucleotide comprises) a sequence complementary to a polynucleotide which comprises as 1'-end sequence, where the coligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in (C the 5'-end sequence/3'-end sequence is selected from those defined in (C the 5'-end sequence/3'-end sequence is selected from those defined in (C the specification. The primer set seal be used in antisense therapy and (C particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the protestine encoded by the full-length cDNAs. The primers allow obtaining of the full-length (C DNAs easily without any specialised methods. AAH03166 to AAH13628 and (C AAH1363) to AAH13679 represent human cDNA sequences; AAB92446 to
